.. network [information] security . risk assessment . compliance ..

globsit was founded in Catania in 2007 to provide resources and continuity in high level autonomous business developed in previous decades in IT technological innovation by a team of bold Sicilian businessmen.

The main idea of the globsit project is that the Information Security is essential for the development of all kinds of business, regardless of size and sector. That is why for about ten years globsit provides excellent information security solutions , with particular attention to the activities of Network Security, Risk Assessment, Compliance. We are recognized leaders in niche or non-conventional areas , in particular in the field of Cyber Security for renewable energy installations, cyber security / monitoring / auditing of SCADA industrial processes, in providing 'anywhere connectivity' through satellite internet.

Meanwhile globsit signed important cooperation agreements with the major world players in the NETWORK SECURITY (Dell-SonicWall), ENTERPRISE CYBER SECURITY SERVICES (F-Secure) and SATELLITE CONNECTIVITY (OpenSky - Tooway) in order to deliver interconnected and monitored services by a single SOC.

globsit protect your business by combining expertise, passion, technology and common sense, to turn problems into opportunities for growth and professional improvement.

Network [Information] Security

An inadequately protected network is the most unsafe place to put your digital data. Intrusion attempts and uncontrolled activity (even within the LAN), infected e-mails, improper use of the web, and corrupted file downloads are just a few of the many problems that must be avoided.

Thanks to ten years experience in Information Security we're able to offer the highest security standards and a system for constant monitoring from our SOC, with the ability to block any intrusion attempt.

Below you'll find listed the main services we offer based on blackbox technologies provided by expressly selected vendors; we use both embedded open source solutions (mainly *BSD) with custom configurations, and also offer full management system solutions and IT Consulting for related subjects and technologies in our expertise on request.

Firewall perimeter security.

Remote secure host connections through **SSL-VPN** without going affecting company information systems.

Proxy Server to speed up and comply with authentication laws.

Encryption to safeguard data and keep it private when moving.

Risk Assessment

Proper risk assessment and the right approach to information security problems are the foundation for the constant process of security education that each of us needs to perform.

The use of an Antivirus and a Firewall means that we are conscious of the problem, but it's a means and not an end. Normally, rather in most cases, there's a tendency to adopt a bottom-up process in information security, e.g. the problem is addressed starting from the bottom, by supplying technological mechanisms that are more or less valid and allow a certain degree of security in specific context and situations; but these are used without any proper evaluation of the severity of the problem in all its complexity.

globsit offers a top-down approach to information security problems: once we understand what resources need to be protected and what threats could attack them, we then plan how to lower risks to an acceptable level; keeping in mind that there's always some residual risk that remains despite all efforts, but that risk will be managed in the most effective way in case of a breach.

We offer risk assessment that starts with proper planning of security policies and includes operating procedures and technology implementation. Technology is therefor only part of a process that includes changes to organizational structure and, certainly, a new way of thinking. It's crucial that people become sensitive to security issues, by showing them how it is pro-actively shaped by each one of us.

Compliance

To comply with the laws set forth by the communications authority for system administrators, world companies had to implement a system of log management for the handling of system logs. IT infrastructure has generated such a quantity of logs that it becomes difficult to save and process logs. In our labs we've implemented a number of solutions for archiving, managing, and cataloging this data in a fast, efficient, and most of all, in a secure way.

The globsit compliance team has accrued strong experience, especially working for PMIs (Small and Medium Companies), by developing projects for log management in data centers with tens of servers and network equipment. Thanks to innovative mobile tools we've been able to manage time critical situations many times, directly at the client's office, by means of H24 remote monitoring from our SOC.
